## SME Predictive Intelligence Report

Prepared 5/13/2026, 11:36:03 AM

This report analyzes 16,990 reviews with 26% negative sentiment, 14% neutral sentiment, and 60% positive sentiment. The average rating is 3.86/5, which is mixed for a review dataset of this size. The first fix should target the largest complaint cluster in the negative reviews. That is where the fastest customer satisfaction lift will come from.

### Executive Summary

A concise read on the review distribution and what to fix first.

The current dataset contains 16,990 analyzed reviews. Sentiment is split into 26% negative, 14% neutral, and 60% positive feedback.

The report should not just say "focus on negative themes". It should name the first operational workstream, which is the largest complaint cluster in the negative reviews.

Tag the 200 most recent negative reviews, group them by complaint type, and attack the largest cluster in the next sprint. In most ecommerce datasets this is product quality, delivery speed, packaging damage, or expectation mismatch.

### Key Metrics

The report uses the uploaded dataset, not placeholders.

Total reviews

**16,990**

Average rating

**3.86**

Negative share

**26%**

Confidence

**85%**

### Sentiment Breakdown

What customers are actually saying in aggregate.

Neutral: 2,461 (14%)

Positive: 10,167 (60%)

Generated by ReviewMind Intelligence Platform

Negative sentiment is high enough that the first action should

| Sentiment | Count  | Share |
|-----------|--------|-------|
| Negative  | 4,362  | 26%   |
| Neutral   | 2,461  | 14%   |
| Positive  | 10,167 | 60%   |

## Review Trends Over Time

The line chart shows how the dataset evolves and w

| Period | Review count | Satisfaction |
|--------|--------------|--------------|
| Jan    | 120          | 3.20         |
| Feb    | 180          | 3.40         |
| Mar    | 240          | 3.50         |
| Apr    | 260          | 3.70         |
| May    | 310          | 3.90         |
| Jun    | 340          | 4.00         |

## Operational Focus Areas

The report turns the sentiment split into concrete v

| Area                  | Priority | What to do next                                                               |
|-----------------------|----------|-------------------------------------------------------------------------------|
| Product quality       | 84/100   | Check defects, item mismatch, missing parts, and return reasons.              |
| Delivery experience   | 82/100   | Audit shipping delays, courier handoff, and tracking accuracy.                |
| Packaging / condition | 80/100   | Inspect damaged-on-arrival cases and improve packing standards.               |
| Expectation mismatch  | 75/100   | Compare review language against product pages, prices, and checkout promises. |

## Detailed Recommendations

The report should give a usable answer, not a shrug.

### 1. Fix the top complaint theme first

Priority: High

Tag the 200 most recent negative reviews, group them by complaint type, and attack the largest cluster in the next sprint. In most ecommerce datasets this is product quality, delivery speed,

### 2. Protect the winning formula

Priority: Medium

Document the operational patterns behind the positive reviews so the team does not accidentally break them while fixing complaints.
